CRYOGENETICS ANNOUNCES AVAILABILITY OF FERTILIZED ZEBRAFISH EMBRYOS

Cryogenetics is excited to announce a new option for our zebrafish clients who wish to have lines returned to them. In addition to shipping straws of cryopreserved material back to our clients, we are now able to provide them with healthy, high quality fertilized embryos. Upon request, clients may now choose to have Cryogenetics perform IVF on their behalf, fertilizing wild type embryos with frozen samples that they have stored with us at our facility in Woburn, MA.

Our broodstock are maintained by expert fish technicians, employing our strict biosecurity protocols to ensure that clean, healthy and robust eggs are available for crossing with the client's sample material. Each delivery of fertilized embryos will be accompanied with a third party health certificate detailing the health status of the donor females.

For questions and pricing, please contact us at mark.rath@cryogenetics.com

NEW IVF KIT AVAILABLE

On some occasions it is preferable to get fertilized embryos returned and other times it is necessary to perform IVF in the laboratory.

Cryogenetics has promised their clients that we will make them «**IVF experts**». As a part of this mission we are now offering a new kit to make IVF more easy to perform in your lab. The kit includes all you need for performing a successful IVF, along with the new egg media **AquaBoost™ OvaCoat**, and is suitable for fertilizing both with fresh and cryopreserved sperm.
